Basics Animation 04: Stop-motion by Barry Purves teaches the skills required to develop as a creative stop-motion animator. Introduce kids to stop-motion animation and animated filmmaking. Animation is everywhere--from movies and TV to apps and video games--and today's tech-savvy kids know all about it. With the accessibility and ease of use of cameras and video-editing software, people of all ages are learning how to make stop-motion animation. In "Animation Lab for Kids," artists, teachers, and authors Laura Bellmont and Emily Brink present exciting, fun, hands-on projects that teach kids a range of animation techniques. From the classic zoetrope, flip book, and cel methods (which don't require any devices or technology) to different methods of shooting, the lessons require no previous experience for either child or adult. Experimenting with a variety of art materials (drawing, clay, and paper cut-outs), young animators will learn to plan a film through writing, storyboarding, and creating sets. The book also features helpful and informative sidebars on the history of the early animation techniques as well as the inspiring work of innovative and influential animators, including Kirsten Lepore, PES, Hailey Morris, and William Kentridge. The authors are co-founders and lead teachers of The Good School, an arts-education school that cultivates and combines traditional art-making skills and the technologies involved in stop-motion animation filmmaking. They teach animation techniques at camps, schools, and events, including the New York International Children's Film Festival.

Basic Animation Stand Techniques describes the use and importance of the animation stand in making animated films for the screen. The book describes the fundamental operation and construction of the animation stand where the film camera is mounted. The text explains in detail how the animation stand holds the camera, which points vertically straight down on the table containing the artwork. The selection describes the zoom movement, the light box, and the cell punch. Then the book discusses the three kinds of methods of animation, namely, modification, substitution, and mechanical movement. The book teaches some basic techniques of animation as well as the use of superimposition, image replacement, back projection, aerial image, fades, or mixes. The text explains exposures at different sized fields and camera exposure sheets, the latter containing detailed instructions on how to shoot each single frame. The book also notes the settings that can be achieved on a modern animation stand, including the counters and calibration of gears and wheels. For example, a movement can be as precise as a hundredth of an inch, while a rotation can be made in a tenth of a degree. The book also provides a fairing table, different exposures for different films, and a method to approximate the amount of film stock left in a magazine. The text is valuable for artists, animators, animation technicians, film directors, and others working in the film industry.

The Basics Animation series follows on from the successful title The Fundamentals of Animation and offers a concise but comprehensive account of a number of definitions and approaches to script, drawing upon the available literature.
