The book examines the major issues in perinatal clinical psychology with the presence of theoretical information and operational indications, through a biopsychosocial approach. The multiplicity of scientific information reported makes this book both a comprehensive overview on the major perinatal mental health disorders and illnesses, and a clinical guide. It covers perinatal clinical psychology through a journey of 15 chapters, putting the arguments on a solid theoretical basis and reporting multiple operational indications of great utility for daily clinical practice. It has well documented new evidence bases in the field of clinical psychology that have underpinned the conspicuous current global and national developments in perinatal mental health. As such, it is an excellent resource for researchers, policy makers, and practitioners – in fact, anyone and everyone who wishes to understand and rediscover, in a single opera, the current scientific and application scenario related to psychological health during pregnancy and after childbirth.

This book offers an overview of acute care surgery around the world, focusing on the four main branches of this novel subdiscipline: trauma, general emergencies, critical care, and rescue surgery. The book's primary goal is to provide a general view of acute care surgery, while addressing the most important issues in depth. The content is divided into three parts, the first of which is dedicated to the general organization of trauma centers, including the composition of modern trauma teams. Protocols of activation and action for the trauma team, as well as damage control procedures both in the emergency room and in the surgical theatre, are described. The book also addresses the development of a trauma registry, together with the quality assessment process that can be applied. In turn, the second part describes the principal protocols for making diagnoses, with special attention to circumstances such as unstable hemodynamics, neurological deterioration, normal vital signs, and penetrating injuries. The book subsequently deals with the most important aspects of trauma to the abdomen, chest, and pelvis, with notes on both surgical and intensive care issues. Practical descriptions of how to treat principal injuries to various organs are also provided. Finally, the third part of the book is dedicated to the most frequent general surgical emergencies and rescue surgical approaches, and includes information on diagnostic support with point of care ultrasound and endoscopic advanced techniques. Presenting cutting-edge strategies, this book will be of interest to professionals involved in surgical and intensive care for emergency conditions, such as colonic perforations, obstructions, acute pancreatitis, biliary tree stones, and caustic injuries.

When are children old enough to understand medical information? When are they mature enough to make wise decisions in their best interests? This book explores these questions through detailed qualitative research. It is based on in-depth interviews with children undergoing surgery, their parents and many of the staff caring for them in four city hospitals. In their own words, the child patients challenge many of the accepted ideas about their rights, interests and abilities.

Lung disease is a major indication for the admittance of the neonate to a specialist intensive care unit, and is a particularly common complication in the pre-term baby where the lungs are insufficiently developed at birth and easily damaged by early treatments. As a consequence, this is an area of intensive international research activity. In this comprehensive update of the well-received first edition, leading researchers from all over the world have been invited to contribute in their specialist areas. The book continues to provide detailed coverage of the pathogenesis, clinical and laboratory features and management of lung disorders in the neonate, with increased emphasis on the underlying immunology and major additions to the sections on respiratory support, chronic lung disease and abnormalities in lung growth and development to reflect the changes that have occurred in these areas since the previous edition appeared in 1995. Providing an unrivalled up-to-date statement on the problems that are faced in the neonatal intensive care unit on a daily basis, this is an invaluable addition to the bookshelves of neonatologists and other personnel involved in the care of critically ill babies.

Medical Education needs to be understood as a continuous process, where professional know-how is an ever-changing synthesis of different types of knowledge, integrating experience, practice and rigorous scientific studies. And it is because of this need that specific national programmes of continuing medical education (CME) have been institutionalised already for several decades now. In these programmes too, the progressive diffusion of the new information and communication technologies (ICTs), particularly the mobile ones, has had and is still having its effects; indeed training schemes based on e-learning and more generally on Technology-Enhanced Learning are more and more widespread. However, there is another fundamental kind of dynamics governing continuing training processes, and that is peer professional knowledge sharing. This often uses various, decidedly more informal, channels which are nowadays hugely potentiated by the networks and mobile technologies (NMTs). But just because they are informal and often based on social networks managed in a restricted group, the experience and methods of these networked communities of professionals often remain unknown within the general CME context. By gathering together important contributions from leading international experts in the field, this book will try to show: (1) how NMTs foster and potentiate formal, non-formal and informal learning processes in the CME context; b) what the possible role of professional social networks in the CME context is; c) how informal learning processes characterised by horizontal (peer-to-peer) knowledge flows can be integrated with more formal ones centred on vertical knowledge flows (ie: flows from authoritative sources to potential users); d) how the learning achieved by informal processes can be assessed in order that credits can be awarded to it within the national CME framework. This book is a valuable tool and source of knowledge for all those directly and indirectly interested in CME processes and in particular in the informal ones centred on the use of social media and mobile technology. Principal audiences for this book are researchers in continuing education and lifelong learning, health institutions, educational institutions, educational managers, policy-makers, CME national agencies.

This timely, comprehensive volume draws on recent advances in molecular, cellular and organismal biology to provide a detailed analysis of the phylogeny and ontogeny of the immune system. This first book to provide broad coverage of this field gives a clear description of cellular and molecular interactions in the development of immune function. Although most of this work is based on studies in vertebrates, the intriguing observations of cytokine-like molecules in invertebrates are discussed. In a final section, the contributors deal with abnormalities in the development and regulation of the immune system, including primary immunodeficiency diseases, and with the normal aging of the immune system. Throughout the book, an effort has been made to compare and integrate information from studies in diverse systems, and to discuss the limitations of such comparisons. This work will be of special interest to immunologists and theoretical, cell and developmental biologists, and much of the book will be useful to physicians working in pediatrics, internal medicine and reproductive medicine.

Following an introduction to the concept of quality of life in old age, the book reviews essential findings from worldwide research into the experiences of older people with regard to nursing care and the impact of these experiences on their quality of life. It investigates health promotion, care provided in nursing homes and assisted living facilities, and palliative care. Each chapter includes a brief introduction to the respective field of nursing care and the problems it has to deal with, concluding with a discussion of their implications for nursing practice in the respective field of care. In closing, the evidence from qualitative research is discussed in relation to current gerontological theories.
